Contents

<i>Series Introduction</i>	<i>vii</i>
<i>Preface</i>	<i>ix</i>
<i>Acknowledgements</i>	<i>x</i>
1 Introduction	1
2 Scope	3
3 The Mechanism of CO₂ Corrosion	4
4 Types of CO₂ Corrosion Damage	6
4.1. Localised Corrosion of Carbon Steel	6
4.2. Localised Corrosion of Carbon Steel Welds	7
5 Key Parameters Affecting Corrosion	9
5.1. Water Wetting	9
5.1.1. Water Characteristics	10
5.1.2. Hydrocarbon Characteristics	10
5.1.3. Top-of-the-Line Wetting	11
5.2. Partial Pressure and Fugacity of CO ₂	12
5.3. Temperature	12
5.4. pH	14
5.5. Carbonate Scale	15
5.6. The Effect Of H ₂ S	15
5.7. Wax Effect	16
6 Prediction of the Severity of CO₂ Corrosion	18
6.1. CO ₂ Corrosion Prediction Models For Carbon Steel	19
7 CO₂ Corrosion Control	24
7.1. Micro-alloying of Carbon and Low Alloy Steels	24
7.1.1. Effect of Chromium	24
7.1.2. Effect of Carbon	25
7.1.3. Effect of Other Alloying Elements	25
7.2. Effect of Glycol and Methanol	26

7.3. pH Control	27
7.3.1. The Role of pH	27
7.3.2. Wet Gas Transportation Lines	27
7.3.3. Different Chemicals and Their Mechanisms	27
7.3.4. pH Monitoring	28
7.4. Corrosion Inhibition	28
7.4.1. Inhibitor Mechanism	29
7.4.2. Inhibitor Efficiency and Inhibitor Performance	30
7.4.3. Inhibitor Partitioning and Persistency	31
7.4.4. Commercial Inhibitor Packages	34
7.4.5. Inhibitor Compatibility	34
7.4.6. Inhibitor Deployment	35
7.4.7. Inhibitor Distribution in Multiphase Pipelines	36
7.4.8. Effect of Flow on Inhibition	36
8 Corrosion Allowance Determination	37
8.1. Design Corrosion Allowance	38
8.1.1. Design Corrosion Rate	38
8.1.2. Design Corrosion Allowance Assessment	38
9 Design Considerations	41
9.1 Well Completions	41
9.1.1. Corrosion Design	42
9.1.2. Corrosion Monitoring	43
9.2. Production Facilities	44
9.2.1. Corrosion Design	44
9.2.2. Multiphase Fluid Behaviour	46
9.2.3. Corrosion Monitoring	47
9.3 Gas Reinjection	49
9.3.1. General Requirements for Gas Reinjection	49
9.3.2. Onshore Delivery Lines	49
9.3.3. Offshore Delivery Lines	50
9.3.4. Injection Wells And Gas Lift Annuli	50
References	51

Preface

Corrosion is a natural potential hazard associated with oil and gas production and transportation facilities. This results from the fact that an aqueous phase is normally associated with the oil and/or gas. The inherent corrosivity of this aqueous phase is then dependent on the concentration of dissolved acidic gases and the water chemistry. The presence of H_2S , CO_2 , brine and/or condensed water with the hydrocarbon not only give rise to corrosion, but also can lead to environmental fracture assisted by enhanced uptake of hydrogen atoms into the steel. CO_2 is usually present in produced fluids and, although it does not cause the catastrophic failure mode of cracking associated with H_2S^* , its presence can nevertheless result in very high corrosion rates particularly where the mode of attack on carbon and low alloy steels is localised. In fact CO_2 corrosion, or 'sweet corrosion', is by far the most prevalent form of attack encountered in oil and gas production and is a major source of concern in the application of carbon and low alloy steels. Hence, the need to have a document which systematically addresses the steps, considerations and parameters necessary to design oil and gas facilities with respect to CO_2 corrosion.

This document sets the scene on design considerations specifically related to CO_2 corrosion. It has been developed from feedback of operating experience, research results and operators' in-house studies. Particular attention has been given to the chemistry of the produced fluid, the fluid dynamics and physical variables which affect the performance of steels exposed to CO_2 -containing environments. The focus is on the use of carbon and low alloy steels as these are the principal construction materials used for the majority of facilities in oil and gas production offering economy, availability and strength.

This document is a practical, industry oriented guide on the subject for use by design engineers, operators and manufacturers. It incorporates much of the recent developments in the understanding of the ways in which detailed environmental and physical conditions affect the risk of CO_2 corrosion. It also describes means of corrosion control. It is comprehensive in addressing CO_2 corrosion of all major items of oilfield equipment and facilities incorporating, production, processing and transportation. As such, it provides a key reference for materials and corrosion engineers, product suppliers and manufacturers working in the oil and gas industry.

* 'Sour corrosion', resulting from the presence of H_2S , is the subject of EFC Publications Numbers 16 and 17.

Acknowledgements

The CO₂ Corrosion Work Group of the EFC Working Party on Corrosion in Oil and Gas Production held its first meeting in September 1993. Since then, several meetings have been held to address industry-wide issues related to engineering design for CO₂ corrosion. The organisation of the Work Group was undertaken by representatives from worldwide oil and gas producers, manufacturers, service companies and research institutions.

In achieving the primary objective, parameters affecting CO₂ corrosion, its mechanism and methods of control have been discussed during the Work Group meetings. These aspects form the core of the present document, Sections of which have been prepared by the Work Group members.

The chairmen of the Working Party and Work Group would like to thank all who have contributed their time and effort to ensure the successful completion of this document. In particular we wish to acknowledge a significant input from these individuals and their respective companies:

J Pattinson, A McMahon and D Harrop, BP, UK

J-L Crolet, Elf, France

A Dugstadt, IFE, Norway

G Schmitt, MFI, Germany

Y Gunaltun, Total, France

E Wade, previously with Marathon, UK

O Strandmyr, Statoil, Norway

W Lang, Bechtel, UK

J Palmer, CAPCIS, UK

M Swidzinski, Phillips, UK

M Celant, MaC, Italy

P O Gartland, CorrOcean, Norway

R S Treseder, CorrUPDATE, USA

J Kolt, Conoco, USA

N Farmilo, AEA Technology, UK

In addition, valuable comments from R Connell and B Pots (Shell, The Netherlands) and T Gooch (TWI, UK) are appreciated.

Finally, one of the editors (MBK) wishes to thank BP for their support and permission to publish some of the information in this document.

Bijan Kermani
